**Abstract**

We present the case of a patient with rheumatoid polyarthrits treated in our department, with a long history of chronic calcifying pancreatitis which was incidentally diagnosed during a renal colic with a pancreatic tumor. Pancreatoduodenectomy with lateral superior mesenteric vein resection was performed, the final pathological examination revealed a malignant solid pseudopapillary neoplasm with a positive lymph node. Clinical, surgical, pathological and a review of the literature are presented.

**Key words:** pancreatoduodenectomy, solid pseudopapillary tumor, rheumatoid polyarthrits
